

ViVa Visibility for Vaccines

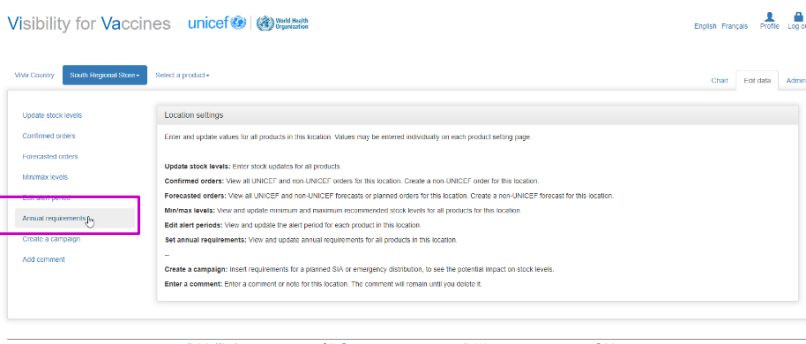

QUICK REFERENCE: Updating Annual Requirements

ViVa calculates the rate of consumption based on “programmatic data”. These are the annual requirements per vaccine collected by UNICEF and uploaded into ViVa once a year. The programmatic data is also the basis for calculating the recommended minimum/maximum stock levels per vaccine. You may wish to modify this programmatic data to account for an increase or decrease in annual vaccine needs or usage rates, or if you are using ViVa for a new vaccine that does not have historical data.

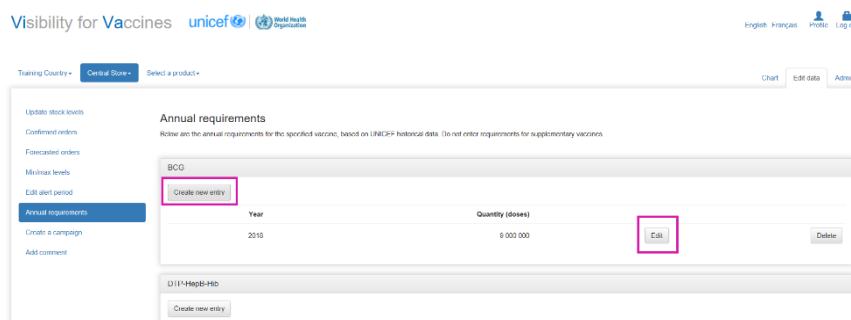

1 From the Location page, click on “Edit data”.

2 From the Edit data page, click on “Annual requirements”.

3 You will see the list of vaccines. If there is no data, click on “Create new entry”, if you want to modify existing data, click “Edit”.

4 Enter the annual requirements and click “Save”.

You will see that the min and max levels, the stock projections and the alerts have been modified based on the updated annual requirements.
